Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present invention relates to a new G-protein coupled receptor (GPCR) comprising greater than 70% amino acid sequence identity to polypeptide comprising greater than 70% amino acid sequence of human GPCRs 7GR21, 7GR130.2, Che amino acid sequence identity to mouse TGR10 cor 90% amino acid sequence identity to mouse TGR10 cor 90% amino acid sequence identity to human novel edg receptor protein, as defined in the specification. The GPCR covalently linked to a solid plase is useful for identified compound that modulates signal cransduction. The identified compound that modulates signal cor signal sease, cerebral cavernous malformations, hyperlipidemia, obesity, dyslexia and cardiac myxoma. The molecules of the invention are useful for diseases such as renal failure, nephritis, nephrotic. Syndrome, asymptomatic urinary abnormalities, rephritis, nephrotic. Or hypertension and nephrolithasis, liver-related disease or condition of hypertension and nephrolithasis, liver-related disease or condition and spleen-associated disorders and others. Modulation of the invention is useful to tread or prevent any of the inventions or diseases. The present amino acid sequence represents the mouse GPCR TGR18 protein of the invention. This sequence is one of the annowed protein coupled receptors of the invention (AAU74904-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; orphan G protein-coupled receptor; GPCR; hCHN10; drug screening; transmembrane receptor; expressed sequence tag; EST; signal cascade.

The hCHM10 CDNA was identified using the human EST (expressed sequence tag) 1365839 as a probe. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of pharmaceutical agents. The proteins may also be used in the study of proremediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 LSISDFAFLCTLPILIKSYANDKGTYGDVLCISNRYVLHTNLYTSILFLTFISMDRYLLM 120

                                                                                                                                of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used in
                                                               The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antihugal; antiparastic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful. In the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune (by immune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative collisis, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and contingent and (i) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; G-protein coupled receptor-3; GCREC-3; therapy; cancer; stroke;

The invention relates to isolated human G-protein coupled receptor (CCREC) polypeptides and their biologically active fragments. GCREC and protein is useful in treating a disease or condition associated with an increase or decrease in expression of functional GCREC. The GCREC's are useful in the diagnosis, treatment and prevention of cell proliferative disorders (cancer, leuksemia, melanoma); neurological disorders (stroke, epilepsy, Parkinson's disease, dementia, Alzheimer's disease); autoimmune inflammatory disorder (thyroiditis, haemolytic anaemia, AIDS, multiple sclerosis); cardiovascular disorder (atherosclerosis, and pectoris),
                      Alzheimer's disease, inflammation; thyroiditis; haemolytic anaemia; AIDS; Acquired Immune Deficiency Syndrome; dementia; nootropic; cholelithiasis; multiple sclerosis; atherosclerosis; angina pectoris; gastroenteritis; diabetes; ulcer; viral infection; immunosuppressive.

subtype that is abundantly expressed in kidney and in many cell subtype that is abundantly expressed in kidney and in many cell lines of megakaryocytic or erythroleukaemic origin and which is activated by ATP, UDP, UTP and UDP. Its amino acid sequence was deduced from a cDNA clone derived from DAMI (ATC CRL 9792) cells. P2U2 and its polypeptides can be expressed in host cells and used to deavelop diagnostic and therapeutic agents. Antagonists and agonists based on the extracellular domains of P2U2 receptor, or which affect receptor function by binding to one of the intracellular domains, can be used to treat diseases caused by aberrant activation of this receptor or to treat diseases whose symptoms can be ameliorated by stimulating or inhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 LSISDFAFLCTLPILIKSYANDKGTYGDVLCISNRYVLHTNLYTSILFLTFISMDRYLLM 120

Human ATP receptor (AAW22732) is structurally related to the G protein-coupled receptor family. It shows 29.8% identity to a murine P2u receptor. Its amino acid sequence was deduced from a human placental cDNA clone (AAP75146). Recombinant ATP receptor can be expressed in bacterial (e.g. E. coli), mammalian (e.g. COS) or insect (e.g. Sf9) host cells and used to screen for agonists and antagonists useful in the treatment of conditions related to underexpression of the receptor (e.g. asthma, Parkinson's disease, acute heart failure, hypotension, urinary retention and osteoporosis) or underexpression of the receptor (e.g. arterial

polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to abstrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate harmatopolesis; and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel human secreted polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 20; Page 392; 765pp; English.

cc human secreted proteins given in AAB45308 to AAB45356. AAB45357 to AAB45384 represent human secreted polypeptide sequences and proteins homelogous to them, which are given in the examplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: antiarthritic; immunosuppressive; antirheumatic; antiproliferative; can deallant; vasotropic; cerebroprotective; nontropic; and vulnerary. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular disorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and can appropriate and coular disorders. The polypeptides can also be used to aid wound healing and coular mannel and coular disorders. The polypeptides can also be used to aid wound healing and coular mine and coular disorders. The polypeptides can also be used to aid wound healing and coular mines and coular mannel and coular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components, AACB1077 to AACB1085 and AABA5307 represent sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cerebroprotective, gynaecological, ADP, adenosine 5'-diphosphate; angina, myocardial infarction; ischaemic attack; preeclampsia; bleeding disorder; carotid endarterectomy; vascular graft surgery; brain disorder; migraine; vascular injury; schizophrenia; eating disorder; depression; angioplasty, peripheral vascular disease; platelet aggregation; restenotic; embolism; thrombocytopaenic purpura; stroke; pertussis toxin-sensitive G protein; G1; disseminated intravascular coagulation; thrombosis.

The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed as P2Y12 receptor and its corresponding cDNA molecule. P2Y12 receptor is the subtype of P2-purinergic receptor. The P2Y12 receptor is expressed selectively in the platelets and brain, and couples to a pertusals toxinselectively in the platelets and brain, and couples to a pertusals toxinselectively in the platelets and brain, and couples to a method for chart responds to ADP. The invention also relates to a method for identifying an agent which is useful for modulating acute myocardial infarction, unstable angina, chronic stable angina, transient ischaemic retaction, unstable angina, chronic stable angina, transient ischaemic thrombosis, embolism, disseminated intravascular coagulation, thrombotic thrombosis, embolism, disseminated intravascular coagulation, thrombotic chrombosytopaenic purpura or a bleeding disorder; thrombotic and thrombotic complications of allowing angioplasty, carcid endarterectomy, post CABG (coronary artery bypass graft) surgery, vascular graft surgery, ost chast complications. PAY12 receptor provides targets for screening synthetic small molecules and combinatorial or naturally occurring compound libraries to regulate platelet aggregation, vascular injury, or disease as well as schizophrenia, eating disorders, depression, migraine and other brain disorders. The present sequence is human P2-purinergic receptor subtype, P2Y1 related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      80 ANDKG-TYGDVLCISNRYVLHTNLYTSILFLTFISMDRYLLMKYPFREHFLQKKEFAILI 138

The invention relates to a novel isolated polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for the sequence which is a polymorphic variant coupled, I (P2RYI) protein or Lits fragment. The polymorphic variant comprises one or more variant amino crids selected from valine at a position 34 and glycine at a position of and function of P2RYI, in expressing P2RYI protein for use in screening function of P2RYI, in expressing P2RYI protein for use in screening of candidate drugs to treat diseases related to P2RYI activity, in P2RYI, and the binding affinity of candidate drugs targeting P2RYI for the treatment of disorders related to platelet aggregation. The haplotyping methods are useful in validating P2RYI as a candidate transpet for treating a specific condition or disease predicted to be target for treating a specific condition or disease associated with P2RYI activity. Or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with P2RYI activity. Or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated contributed with P2RYI activity. Or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with P2RYI activity. The transgenic animals are useful for studying continued of therapeutic agents and compounds for disorders related to efficacy of therapeutic agents and compounds for disorders related to efficacy of therapeutic agents and compounds for disorders related to platelet aggregation in a biological system. The present sequence completed protein 1 (P2RYI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New purinergic receptor P2X G-protein coupled 1 (P2RY1) gene polymorphic variants, useful e.g. in studying the expression and function of P2RY1 and screening candidate drugs for treating diseases related to P2RY1 activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chen R,
rne invention relates to a novel isolated polypeptide compirising a sequence which is a polymorphic variant of a reference sequence for the sequence which is a polymorphic variant of a reference sequence for the purinergic receptor P2V, G-protein coupled, I (PZRYI) protein or its cacks selected from value at a position 34 and glycine at a position of a cacks selected from value at a position 35. The polymorphic variants are useful in studying the expression of for candidate drugs to treat diseases related to PZRYI activity, in studying the effect of the variation on the biological activity, in caudidate drugs to treat diseases related to PZRYI activity, in the treatment of disorders related to platelet aggregation. The carget for treating a specific condition or disease predicted to be target for treating a specific condition or disease predicted to be target for treating a specific condition or disease predicted to be target for treating a specific condition or disease sascociated with PZRYI activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with PZRYI activity, or in the design of clinical trials of expression of the PZRYI isogenes in vivo, for in vivo screening and testing of drugs targeted against PZRYI protein, and for testing the efficacy of therapeutic against PZRYI protein, and for testing the efficacy of therapeutic against PZRYI protein, and for testing the efficacy of the agence of human purinergic receptor PZY, cepresents the amino acid sequence of human purinergic receptor PZY, and design from the human wild type PZRXI sequence given in Figure 3 (see Aurinosa).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

                                                                                                                                                                                                                                                                                                                                  hRUP21. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilized to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                                                                                      Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -

The invention comprises the amino acid and coding sequence of a human G protein-coupled receptor. The DNA and protein sequences of the invention are useful for developing drugs to prevent or treat (gene therapy): central nervous system diseases; endocrine diseases; metabolic diseases;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer; respiratory diseases; digestive diseases; immune diseases; infilammations; infections; and circulatory diseases. The present amino acid sequence represents the human G protein-coupled receptor of the
